INTRODUCTION 1-1

AIM OF DESIGN FOR QUALITY 1-1

FOCUS 1-1

REFERENCES 1-2

PROBABILISTIC DESIGN 2-1

INTRODUCTION 2-1

TYPES OF PROBABILITY DISTRIBUTIONS 2-2

Normal 2-2

Lognormal 2-2

Weibull 2-3

Exponential 2-3

Triangular 2-3

Uniform 2-3

Poisson (discrete) 2-3

Binomial (discrete) 2-4

Geometric (discrete) 2-4

Custom 2-4

Comparison of distributions 2-4

DESCRIBING PROBABILITY DISTRIBUTIONS 2-5

Types of description 2-5

Properties of probability density functions 2-5

Functions of random variables 2-6

Notation 2-6

In sum 2-6

Uniformly distributed design parameter 2-6

GRAPHICAL FUNCTIONS OF A RANDOM VARIABLE 2-6

The concept 2-7

The fundamental formula 2-7

Dimensional considerations 2-8

Examples 2-8

A linear function through zero 2-8

A general linear function 2-9

A concave function 2-9

A convex function 2-10

Sketching distributions 2-10

Sound output 2-10

ANALYTICAL FUNCTIONS OF A RANDOM VARIABLE 2-11

Definition of an invertible function 2-11

Non-invertible functions of a random variable 2-11

Examples of invertible and non-invertible functions 2-11

Invertible functions 2-11

Non-invertible functions 2-12

Invertible functions of a random variable 2-12

Addition of a constant: $[z = x + a]$ 2-12

Multiplication by a constant: $[z = a x]$ 2-13

The general linear transformation: $[z = a x + b]$ 2-13

The exponential transformation: $[z = e^x]$ 2-13

Example 2-14

Exponential transformation of a Uniform distribution 2-14

Sphere volume 2-14

Alloy steel 2-14

MOMENTS 2-15

(Non-central) moments 2-15

Central moments 2-16

Variance 2-16

Skew 2-16

Kurtosis 2-16

Standard deviation 2-17

Coefficient of variation 2-17

Variance ratio 2-17

Coefficient of skewness 2-17

Coefficient of kurtosis 2-17

Terminology 2-18

A note on notation 2-18

THE NORMAL DISTRIBUTION 2-18

Probability of a continuous random variable 2-20

Sketching a Normal distribution 2-20

MEANS FROM NOMINAL VALUES 2-20

STANDARD DEVIATIONS FROM TOLERANCES 2-21

Estimation from tolerance range 2-21

Estimation from limited data 2-21

Estimation from knowledge of manufacturer 2-21

THE EXPECTATION OPERATOR 2-22

The expectation of sums and products 2-22

Constant 2-22

Linear sum 2-22

Product of independent random variables 2-22

Relation of moments to the Expectation 2-22

Non-central moments as Expectations 2-22

Central moments as Expectations 2-23

Moments as Expectations 2-23

Relation of central and non-central moments 2-23

Central moments in terms of non-central moments 2-23

Non-central moments in terms of central moments 2-23

Expectation of a linear sum 2-23

First central moment 2-23

Central and non-central moments 2-24

Variance and skew 2-24
Mean values of a power 2-24
Mean second moment of area 2-24
Volume of sphere 2-24

LINEAR FUNCTIONS 2-25

Introduction 2-25

General formulae 2-25

Sums, differences and multiples 2-26

Linear functions of normal distributions 2-26

The Central Limit Theorem 2-27

Inconsistency? 2-28
Tolerance build-up 2-28
Springs in parallel 2-29
Counterweights 2-29
Algenon and Biggles 2-29
Machine support 2-29
Moon lander 2-30

RELIABILITY 2-30

Operating windows 2-31

Example: Paper feeder operating window 2-31

Supply and demand 2-32

Estimation of the reliability 2-33

Bolt strength reliability 2-34
Buoyancy force reliability 2-34
Bearing fit 2-34
Shaft failure 2-34
Fitting of car doors and windshields 2-35

PRODUCTS OF RANDOM VARIABLES 2-35

The mean of a product 2-35

The variance of a product 2-36

The skew of a product 2-36

Volume of a cube 2-36

POSITIVE INTEGER POWERS 2-37

The mean of a positive integer power 2-37

Tables for a Normally distributed random variable 2-37

Inconsistency? 2-38

GENERAL FUNCTIONS 2-38

Introduction 2-38

The basic algorithm 2-39

Calculation of the mean 2-39

Calculation of the nth central moment 2-39

The theoretical foundation 2-39

Assumptions 2-39

Formulae 2-40

How to write down a Taylor series 2-40

How to write down the expectation of a function 2-41

The shortest way to write down the expectation 2-41

Calculation of the variance of a function 2-43

Computer implementation 2-44

Mean of a function of one variable 2-44

Variance of a function of one variable 2-44

Mean of a function of two variables 2-44

Probabilistic means 2-45

SUMMARY OF APPROXIMATE FORMULAE 2-45

First order approximation 2-45

Mean 2-45

Variance 2-45

Second order approximation 2-46

Mean 2-46

Variance 2-46

Approximate formulae 2-46

Right-angled bracket 2-46

Applications for probabilistic design 2-46

GENERAL POWER FUNCTIONS 2-47

The mean of a general power function 2-47

The variance of a general power function 2-47

The coefficient of variation of a power function 2-47

The quotient of two random variables 2-48

The mean of a quotient 2-48

The variance of a quotient 2-48

The inverse of a random variable 2-48

The mean of an inverse 2-48

The variance of an inverse 2-49

The mean of a square 2-49

Volume of a cylinder 2-49

Second moment of area 2-49

Coefficients of variation 2-49

Experimental formula 2-50

First order approximation 2-50

Springs in series 2-50

The minimum diameter of a rod in tension 2-51

ROBUST DESIGN 3-1

INTRODUCTION 3-1

Background 3-1

What is Robust Design? 3-1

Sources of variation 3-2

Why design robust products? 3-2

Comparison with other types of optimization 3-3

How are robust products designed? 3-3

Sources of variation 3-3

Designing robust products 3-4

TERMINOLOGY 3-4

Failure modes 3-4

Design parameters 3-4

Feasible domains 3-5

Quality variables 3-5

Critical parameters 3-5

Terminology for robust design 3-6

THE CONCEPT OF ROBUSTNESS 3-6

The first order robustness problem 3-7

The general robustness problem 3-7

Visualization of the robustification process 3-8

The concept of robustness 3-8

First order robustness problem 3-8

Exploitation of non-linearity 3-8

TAGUCHI'S QUALITY LOSS FUNCTION 3-9

One item 3-9

Many items 3-10

Derivation of average quality loss 3-11

Example of average quality loss 3-11

FIRST ORDER ANALYTICAL ROBUST DESIGN 3-11

The algorithm 3-11

Contribution analysis 3-12

Notes on methodology 3-12

Robustification methodology 3-13

EXAMPLE: LOCATING STRUTS 3-14

EXAMPLE: SIMPLE POWER MODEL 3-14

Simple power model 3-15

Stiffness of a cantilever 3-15

Wooden cantilever 3-16

Helical spring 3-16

CASE STUDY: PASSIVE FILTER NETWORK 3-18

Origin of the problem 3-18

Statement of the problem 3-18

Approach 3-18

Nomenclature 3-19

The filter cut-off frequency 3-20

The galvanometer full-scale deflection 3-20
The results 3-20

SIMULATION 4-1

INTRODUCTION 4-1

Simulation in design 4-1
The simulation process 4-2

THE MONTE CARLO METHOD 4-2

The Monte Carlo method for two parameters 4-3
Latin Hypercube sampling 4-4
Simulation software 4-5

STIFFNESS OF A CANTILEVER SPRING 4-5

The software 4-5
The spreadsheet 4-5
Performing the simulation 4-6
Comparison with analytical results 4-8

MOMENT AND SIMULATION METHODS 4-9

CASE STUDY: WIPER BEARING TORQUE 4-10

The origin of the problem 4-10
The problem 4-10
The model 4-10
Conclusions 4-10

CASE STUDY: WRAP-SPRING CLUTCH 4-13

Background 4-13
Solution strategy 4-13
Objectives 4-13
The wrap spring clutch model 4-13
The clutch 4-14
Reference for wrap-spring clutches 4-14
Control, noise and adjustment parameters 4-15

Feasible domain constraints 4-16
Estimation of standard deviations 4-16
Design parameter distribution types 4-16
The initial design results 4-16
4-17
The robustified results 4-17
Major modifications 4-18

Reduced reliability due to wear 4-18

Wear formula 4-19
